Adversarial Bandit Linear Optimization

Chen-Yu Wei

Review: Online Linear Optimization

Given: Convex feasible set $\Omega \subseteq \mathbb{R}^d$

For time $t = 1, 2, \ldots, T$:

Learner chooses a point $w_t \in \Omega$

Environment reveals a reward vector $r_t \in \mathbb{R}^d$

$$\text{Regret} = \max_{w \in \Omega} \sum_{t=1}^{T} \langle w, r_t \rangle - \sum_{t=1}^{T} \langle w_t, r_t \rangle$$

Projected Gradient Descent

Arbitrary $w_1 \in \Omega$

$w_{t+1} = \Pi_\Omega(w_t + \eta r_t)$

Review: Online Linear Optimization

Theorem. Projected Online Gradient Descent ensures

$$\text{Regret} = \max_{w^\star \in \Omega} \sum_{t=1}^{T} \langle w^\star - w_t, r_t \rangle \leq \frac{\max_{w \in \Omega} \|w\|_2^2}{\eta} + \eta \sum_{t=1}^{T} \|r_t\|_2^2$$

Bandit Linear Optimization

Given: Convex feasible set $\Omega \subseteq \mathbb{R}^d$

For time $t = 1, 2, \ldots, T$:

Environment decides the reward vector $r_t \in \mathbb{R}^d$

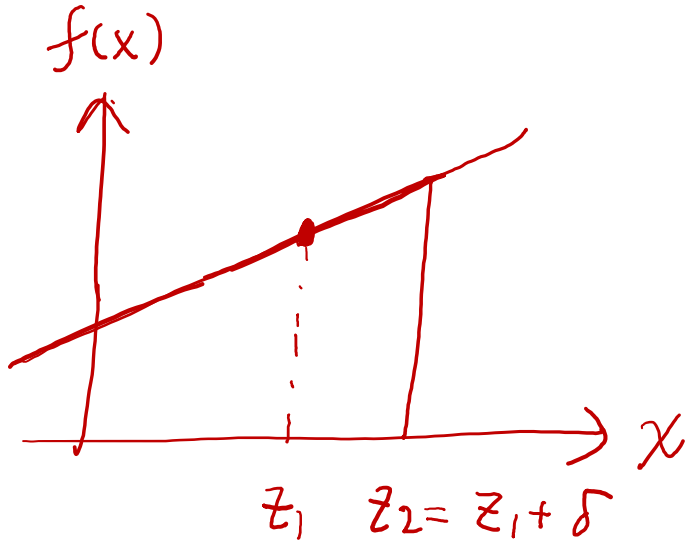
Learner chooses a point $w_t \in \Omega$

Environment reveals $\langle w_t, r_t \rangle + \epsilon_t$, where ϵ_t is a zero-mean noise

$$\text{Regret} = \max_{w \in \Omega} \sum_{t=1}^{T} \langle w, r_t \rangle - \sum_{t=1}^{T} \langle w_t, r_t \rangle$$

Unbiased Gradient Estimator

Goal: construct a $\hat{r}_t \in \mathbb{R}^d$ with $\mathbb{E}[\hat{r}_t] = r_t$ (using only the feedback $\langle w_t, r_t \rangle + \epsilon_t$)



Env tells $f(z)$

$f(x) = ax + b$

$$\begin{cases} f(z_1) = a z_1 + b \\ f(z_2) = a z_2 + b \end{cases}$$

$$f(z_1) - f(z_2) = a(z_1 - z_2)$$

$$a = \frac{f(z_2) - f(z_1)}{z_2 - z_1} = \frac{f(z_2) - f(z_1)}{\delta}$$

$$z = \begin{cases} z_1 & \text{with prob } 1/2 \\ z_2 & \text{with prob } 1/2 \end{cases}$$

$$\hat{a} = \frac{2 f(z_2)}{\delta} \mathbb{1}\{z = z_2\} - \frac{2 f(z_1)}{\delta} \mathbb{1}\{z = z_1\}$$

$$\mathbb{E}[\hat{a}] = \frac{2 f(z_2)}{\delta} \cdot \frac{1}{2} - \frac{2 f(z_1)}{\delta} \cdot \frac{1}{2} = a$$

Unbiased Gradient Estimator (1/3)

$e_i = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 1 \\ 0 \\ \vdots \\ 0 \end{bmatrix} \leftarrow i\text{-th entry}$

Uniformly randomly choose a direction $i_t \in \{1, 2, \ldots, d\}$

Uniformly randomly choose $\alpha_t \in \{1, -1\}$

Sample $\widetilde{w}_t = w_t + \delta \alpha_t e_{i_t}$

Observe $y_t = \langle \widetilde{w}_t, r_t \rangle + \epsilon_t$

Define $\hat{r}_t = \frac{dy_t}{\delta} \alpha_t e_{i_t}$

$\hat{r}_t = \frac{d}{\delta}\left(\langle \widetilde{w}_t, r_t \rangle + \epsilon_t\right) \alpha_t e_{i_t}$

$\simeq \frac{d}{\delta}\left(\langle w_t + \delta \alpha_t e_{i_t}, r_t \rangle + \epsilon_t\right) \alpha_t e_{i_t}$ //

$\mathbb{E}[\hat{r}_t] = \mathbb{E}\left[\underbrace{\frac{d}{\delta}\left(\langle w_t, r_t \rangle\right) \alpha_t e_{i_t}}_{0} + \frac{d}{\delta}\langle \delta \alpha_t e_{i_t}, r_t \rangle \alpha_t e_{i_t}\right]$

$\mathbb{E}\left[d \langle e_{i_t}, r_t \rangle e_{i_t}\right]$

$= d \sum_{i=1}^{d} \frac{1}{d} \langle e_i, r_t \rangle e_i$

$= \sum_{i=1}^{d} \langle e_i, r_t \rangle e_i = r_t$

Unbiased Gradient Estimator (1/3)

Unbiased Gradient Estimator (2/3)

Uniformly randomly choose s_t from the unit sphere $\mathbb{S}_d = \{s \in \mathbb{R}^d : \|s\|_2 = 1\}$

Sample $\widetilde{w}_t = w_t + \delta s_t$

Observe $y_t = \langle \widetilde{w}_t, r_t \rangle + \epsilon_t$

Define $\hat{r}_t = \frac{d y_t}{\delta} s_t$

Unbiased Gradient Estimator (3/3)

Choose $s_t \sim \mathcal{D}$ with $\mathbb{E}_{s\sim\mathcal{D}}[s] = 0$

Sample $\widetilde{w}_t = w_t + s_t$

Observe $y_t = \langle \widetilde{w}_t, r_t \rangle + \epsilon_t$

Define $\hat{r}_t = y_t H_t^{-1} s_t$ where $H_t \coloneqq \mathbb{E}_{s\sim\mathcal{D}}[ss^\top]$

Projected Gradient Descent for Bandit Linear Optimization

Assume the feasible set Ω contains a ball of radius δ

Define $\Omega' = \{w \in \Omega:\ \mathcal{B}(w, \delta) \subset \Omega\}$

Arbitrarily pick $\widetilde{w}_1 \in \Omega'$

For $t = 1,2, \ldots, T$:

Let $\widetilde{w}_t = w_t + \delta s_t$ where $s_t \in \mathbb{R}^d$ is uniformly sampled from unit sphere

Receive $y_t = \langle \widetilde{w}_t, r_t \rangle + \epsilon_t$

Define

$$\hat{r}_t = \frac{d y_t}{\delta} s_t$$

Update policy:

$$w_{t+1} = \Pi_{\Omega'} \left(w_t + \eta \hat{r}_t \right)$$

Regret Bound for Bandit Linear Optimization

Theorem. Suppose $\max_{w \in \Omega} \|w\| \leq D$, $\max_{t} \|r_t\| \leq G$. Then projected GD for BLO ensures

$$\text{Regret} = \max_{w^\star \in \Omega} \mathbb{E}\left[\sum_{t=1}^{T} \langle w^\star - w_t, r_t \rangle\right] \leq O\left(\frac{D^2}{\eta} + \eta \frac{d^2 D^2 G^2}{\delta^2} T + \delta G T\right) = O\left(DG\sqrt{d}T^{3/4}\right)$$

Bandit Optimization / Zeroth-Order Optimization

For time $t = 1, 2, \ldots, T$:

Learner chooses a point w_t

Environment reveals $R_t(w_t) + \epsilon_t$, where ϵ_t is a zero-mean noise

Doubly Robust Estimator

Unbiased Estimator vs. Regression Estimator

$$\hat{r}_t = y_t H_t^{-1} s_t \text{ where } H_t \coloneqq \mathbb{E}\left[s_t s_t^\top\right]$$

$$\hat{r}_t(a) = \frac{r_t(a)\mathbb{I}\{a_t = a\}}{p_t(a)}$$

Unbiased High variance

$$\hat{\theta}_t = \operatorname*{argmin}_\theta \sum_{i=1}^{t-1} \left(w_i^\top \theta - r_i\right)^2 + \|\theta\|^2$$

$$\hat{\theta}_t(a) = \frac{\sum_{i=1}^{t-1} r_i(a)\mathbb{I}\{a_i = a\}}{N_t(a)}$$

Biased Low variance

An estimator that maintains the unbiasedness but with reduced variance?

Doubly Robust Estimator

$$\hat{r}_t = \left(y_t - \left\langle \tilde{w}_t, \hat{\theta}_t \right\rangle\right) H_t^{-1} s_t + \hat{\theta}_t$$

$$\hat{r}_t(a) = \frac{\left(r_t(a) - \hat{\theta}_t(a)\right) \mathbb{I}\{a_t = a\}}{p_t(a)} + \hat{\theta}_t(a)$$

Summary for Bandits

- Value-based approach
  - Basic idea: **Regression**
  - Exploration strategies
    - Randomization based on $\hat{R}_t(x_t, a)$ (BE, IGW)
    - Adding uniform exploration (EG)
    - (Randomized) exploration bonus (UCB, TS)
- Policy-based approach
  - Basic idea: **Gradient updates subject to distance regularization**
  - Exploration strategies:
    - Intrinsic randomization (Exp3, IGW)
    - Adding extra uniform distribution (Exp3-1)
    - High baseline (Exp3-2)
    - Perturbed policy (PGD)
  - Exploration bonus is also used in policy-based approach (my talk at AI/ML seminar)
