Policy Evaluation

Chen-Yu Wei

Policy Evaluation

Given: a policy π

Evaluate $V^{\pi}(s)$ or $Q^{\pi}(s,a)$

On-policy policy evaluation: the learner can execute π to evaluate π

74(·(s)

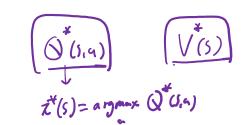

Off-policy/offline policy evaluation: the learner can only execute some $\pi_b \neq \pi$, or can only access some existing dataset to evaluate π

$$(S_{i,\alpha_{i}}, r_{i}, S_{i,\alpha_{i}}, a_{i}, \dots)$$

Use cases:

- Approximate policy iteration: $\pi^{(k)}(s) = \underset{a}{\operatorname{argmax}} Q^{\pi^{(k-1)}}(s, a)$
- Estimate the value of a policy before deploying it in the real world, e.g., COVID-related border measures, economic recovery policies, or policy changes in recommendation systems.

Value Iteration for V^{π} / Q^{π}

Input:
$$\pi$$

For
$$k = 1, 2, ...$$

$$\forall s, \qquad V^{(k)}(s) \leftarrow \sum_{a} \pi(a|s) \left(R(s,a) + \gamma \sum_{s'} P(s'|s,a) V^{(k-1)}(s') \right)$$

Input: π

For
$$k = 1, 2, ...$$

$$\bigcirc_{(i)} \rightarrow \bigcirc_{\mathcal{I}}$$

$$\forall s, a, \qquad Q^{(k)}(s, a) \leftarrow R(s, a) + \gamma \sum_{s', a'} P(s'|s, a) \, \pi(a'|s') Q^{(k-1)}(s', a')$$

On-Policy Policy Evaluation

LSPE and TD

For
$$k=1, 2, ...$$
 $a_i \sim z(\cdot|s_i)$ $f(r_i) = R(s_i, a_i)$ $f(r_i) = R(s_i, a_i)$ Collecting samples $\{(s_i, r_i, s_i')\}_{i=1}^n$ using π Least

$$\theta_{k} \leftarrow \underset{\theta}{\operatorname{argmin}} \sum_{i=1}^{n} \left(V_{\theta}(s_{i}) - r_{i} - \gamma V_{\theta_{k-1}}(s'_{i}) \right)^{2} \qquad \bigvee_{s} \left(S_{k}(s) \right) \left(R(s_{i}) + \gamma \right) \left(R(s_{i})$$

Policy Evaluation (LSPE)

$$V(s) \approx \left(\sum_{\alpha} z(a|s) \left(R(s, \alpha) + V\right) + \left(\sum_{\alpha} V_{0_{k-1}}(s')\right)\right)$$

For
$$i = 1, 2, ...$$

Draw $a_i \sim \pi(\cdot | s_i)$

Observe reward r_i and next state s_{i+1}

$$\theta_i \leftarrow \theta_{i-1} - \alpha \nabla_{\boldsymbol{\theta}} \left(V_{\boldsymbol{\theta}}(s_i) - r_i - \gamma V_{\boldsymbol{\theta}_{i-1}}(s_{i+1}) \right)^2$$

Temporal difference learning

TD learning

LSPEQ and TDQ TD

For k = 1, 2, ...

Collecting samples $\{(s_i, a_i, r_i, s_i')\}_{i=1}^n$ using π

$$\theta_k \leftarrow \underset{\theta}{\operatorname{argmin}} \sum_{i=1}^n \left(Q_{\theta}(s_i, a_i) - r_i - \gamma \sum_{a'} \pi(a'|s_i') Q_{\theta_{k-1}}(s_i', a') \right)^2$$

For i = 1, 2, ...

Draw $a_i \sim \pi(\cdot | s_i)$, observe reward r_i and next state s_{i+1}

$$\theta_i \leftarrow \theta_{i-1} - \alpha \nabla_{\boldsymbol{\theta}} \left(Q_{\boldsymbol{\theta}}(s_i, a_i) - r_i - \gamma \sum_{a'} \pi(a'|s_i') Q_{\boldsymbol{\theta}_{k-1}}(s_i', a') \right)^2$$

 $\frac{A \ge 0 : A : s \text{ psd}}{A \ge B = A - B : s \text{ psd}}$

TD with Linear Function Approximation

BC:
$$R(S,u) + \sqrt{t} \max_{S' = P(S,u)} \widetilde{Q}(S,u') = \varphi(S,u)^T Q^* \qquad \forall \widetilde{Q}$$

Let μ be the stationary state distribution under policy π . Furthermore, assume

- (1) $V^{\pi}(s) = \phi(s)^{\mathsf{T}} \theta^{\star}$ (realizability assumption)
- (2) $\mathbb{E}_{s \sim \mu}[\phi(s)\phi(s)^{\mathsf{T}}] \geqslant \rho I$ for some $\rho > 0$ (coverage assumption)

Then the following TD update:

Realizability in
$$Q^*$$
:
$$Q^{\dagger}(S_{in}) = P(S_{in})^{\top} Q^{*}$$

imply (set $\widetilde{Q} = Q^*$)

For
$$i=1,2,...$$
In fact, even if the samples are generated as $a_i \sim \pi(\cdot|s_i)$, $r_i = \pi(s_i,a_i)$, $s_{i+1} \sim P(\cdot|s_i,a_i)$

$$Sample s \sim \mu, \quad a \sim \pi(\cdot|s), \quad r \sim R(s,a), \quad s' \sim P(\cdot|s,a)$$

$$\theta_i \leftarrow \theta_{i-1} - \alpha_i \; (\phi(s)^T \theta_{i-1} - r - \gamma \phi(s')^T \theta_{i-1}) \phi(s)$$

converges to θ^* with properly chosen α_i .

$$V^{\mathbf{z}}(s) = \phi(s)^{\mathsf{T}} \boldsymbol{\theta}^{*}$$

$$\|\theta_{i+1}-\theta^*\|^2 = \|\underline{\theta_i} - \alpha\left(\phi(s)^T\theta_i - r - \gamma\phi(s')^T\theta_i\right)\phi(s) - \underline{\theta}\|^2 \text{ where } s \sim \mu, \ \alpha \sim \pi(\cdot|s), \ (r) = R(s,\alpha)$$

$$= \| \phi_{i} - \phi^{*} \|^{2} - 2\alpha \left(\phi_{i} - \phi^{*} \right)^{T} \left(\phi_{i}(s)^{T} \phi_{i} - V - \gamma^{T} \phi_{i}(s)^{T} \phi_{i} \right) \phi(s) + \alpha^{2} \|g\|^{2}$$

$$f(0) = (0 - 0^4)^2$$

$$-2 \propto (\theta_{i} - \theta^{*})^{T} E \left[\phi(s)^{T} \theta_{i} - (y - y) \phi(s')^{T} \theta_{i} \right]$$

$$+ E \left[-\phi(s)^{T} \theta^{*} + (y + y) \phi(s')^{T} \theta^{*} \right]$$

$$\begin{split}
& = \left[\left\| \theta_{i,n} - \theta^{t} \right\|^{2} \right] = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\theta_{i} \right)^{T} \theta_{i} - \gamma - \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right] + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} - \gamma - \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\

& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \\
& = \left\| \left(\theta_{i} - \theta^{t} \right)^{T} \underbrace{\mathbb{E} \left[\left(\phi_{i} \right)^{T} \theta_{i} + \gamma \right] \phi(s')^{T} \theta_{i}}_{\qquad \qquad } \right\} + \alpha^{T} \left\| g \right\|^{2} \right\|^{2}$$

$$s' \sim P(\cdot|s,a)$$

$$+ \alpha \|g\|$$

$$= \mathbb{E} \left[-\sqrt{x}(s) + \gamma + \gamma \right] \frac{\sqrt{x}(s')}{\sqrt{s'}}$$

$$= \mathbb{E} \left[-\sqrt{x}(s) + \sum_{\alpha} x(\alpha|s) \left(R(S,\alpha) + \gamma \right) \right] \frac{\sqrt{x}(s')}{\sqrt{s'}}$$

$$= \frac{1}{2} \left[-\sqrt{x}(s) + \sum_{\alpha} x(\alpha|s) \left(R(S,\alpha) + \gamma \right) \right] \frac{\sqrt{x}(s')}{\sqrt{s'}}$$

Comparison

Why does **Linear TDQ** converge (and converges to the correct solution) but **Linear Q-Learning** diverges?

Comparison

Under coverage assumption (i.e., the data $\{(s_i, a_i, r_i, s_i')\}$ sufficiently cover every state-action pair / feature space)

| | LSVI | Watkins's Q-Learning | On-Policy LSPE(Q) / TD(Q) |
|-------------------|--|---|---|
| Tabular | $Q^{(k)} \to Q^*$ | $Q^{(k)} \to Q^*$ | $V^{(k)} \to V^{\pi} / Q^{(k)} \to Q^{\pi}$ |
| Linear Approx. | $Q^{(k)} \rightarrow Q^*$ under Bellman completeness | Diverges even with Bellman completeness | under realizability |
