## Reinforcement Learning: Introduction

Chen-Yu Wei

### RL is a New Regular Course in UVA CS

- From this semester, the CS department makes RL a regular course
  - CS 4501 → CS 4771
  - CS 6501 → CS 6771
- There will be Graduate RL and Undergraduate RL every semester
  - We will use the following pattern in the near future (at least 2 years)

	Fall	Spring	
Undergraduate	Prof. Shangtong Zhang	Me	
Graduate	Me	Prof. Shangtong Zhang	

#### **Platforms**

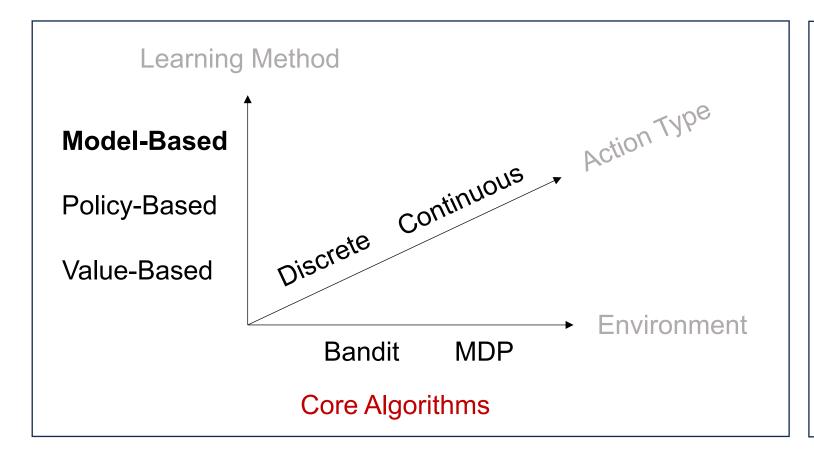

- Course website: <a href="https://bahh723.github.io/rl2025fa/">https://bahh723.github.io/rl2025fa/</a>
  - Syllabus, announcement, slides, lecture recordings
  - Can be accessed from Lou's List or my personal website
- Gradescope (haven't created)
  - Homework submission
- Piazza (haven't created)
  - Questions and discussions

They will be created once the student list becomes more stable (e.g., next week).

### **Topics in This Course**

- The **math** behind **basic** RL algorithms
- We will follow the previous semester (Spring 2025) closely (link)

### **Topics in This Course**

Exploration in MDPs
Inference-Time Algorithms
Imitation Learning

**Special Topics** 

**Bold** are tentative new topics in this semester

This semester I plan to have less *in-class* math proofs – the proofs go to homework.

### **Prerequisites**

- Linear Algebra, Probability, Calculus, Machine Learning
- Convex Optimization
- Python

Assignments are sometimes math heavy (check the HWs in previous semesters)

### Recommended Resources (longer list)

- Courses
  - UC Berkeley CS285
- Webpages
  - OpenAl SpinningUp
- Books
  - Sutton and Barto, <u>Reinforcement Learning</u>: <u>An Introduction</u>
  - Agarwal, Jiang, Kakade, and Sun, Reinforcement Learning: Theory and Algorithms
- Implementations
  - OpenAl StableBaseline3
  - ShangtongZhang

### Assignments (60%): 4 Problem Sets

A mixture or one of the following:

- Math / algorithm design problems
  - Submission: Latex or hand-writing + taking photo
- Programming tasks (using PyTorch)
  - Might need you to plot results or report numbers
  - Submission: It's usually easier to do them in Latex (I'll release latex template)

### Assignments (60%): 4 Problem Sets

- Late policy
  - 10 free late days distributed to all assignments as you like
  - No assignment can be submitted 7 days after its deadline
  - Each additional late day results in 10% deduction in the semester's assignment grade

#### Examples

- HW1: 3 days late, HW2: 6 days late, HW3: 3 days late, HW4: 2 days late
   → HW grade \*= 0.6
- HW1: 8 days late, HW2: 6 days late, HW3: 3 days late, HW4: 2 days late
   → HW1 = 0 points and HW grade \*= 0.9

## Final Project (35%)

- Breakdown
  - Proposal (5%):  $\leq$  3 pages in NeurlPS format
  - Midterm report (5%):  $\leq$  3 pages in NeurlPS format
  - Presentation (10%):
     Upload a ~10 mins video to Panopto (a shared online space)
  - Online discussions (5%): Discussions on Panopto
  - Final report (10%): ≤ 8 pages in NeurIPS format

- Types of projects (basically any)
  - Application, algorithm design, systematic comparison, theoretical understanding, survey...
- Goal: Apply RL techniques to problems you're interested in.

### Final Project (35%)

- It may be built on existing projects
  - Describe in the proposal the current status of the project and what's new (otherwise the proposal will get no points)
- 2-3 students in a group (no solo project is allowed)
- Proposal deadline: September 27

### Participation (5%)

- You will get
  - $\geq$  1 if attendance rate  $\geq$  30%
  - $\geq$  2 if attendance rate  $\geq$  50%
  - ≥ 3 if attendance rate ≥ 80% or if you have occasional interaction in the class or piazza (not including final presentation)
  - = 5 if you have very active interaction in the class or piazza

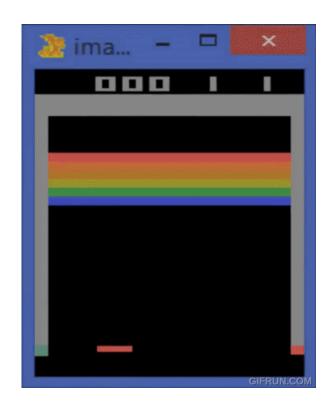

#### **TA & Office Hour**

- TA: Braham Snyder
  - Email: dqr2ye@virginia.edu
  - Office hour: TBD

- Me
  - Email: chenyu.wei@virginia.edu
  - Office hour: Monday 3:30-4:30pm at Rice 409
- Starting from the next week

## **Learning To Make Decisions from Interactions**

### **Games**

10 mins training

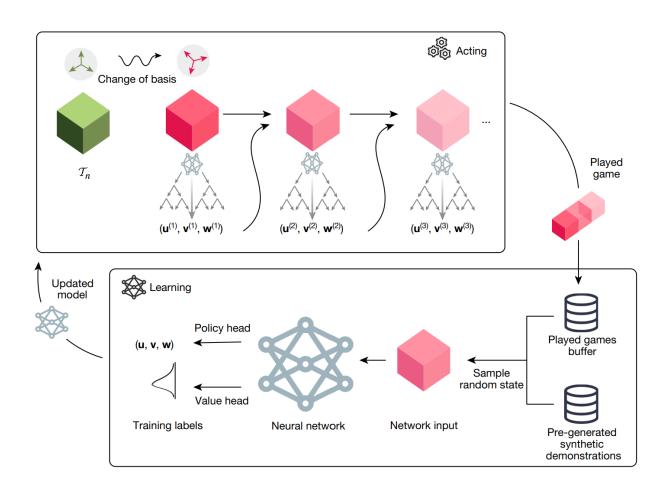

120 mins

240 mins

### Algorithm Discovery (faster matrix multiplication)

Size (n, m, p)	Best method known	Best rank known	•	nsor rank Standard
(2, 2, 2)	(Strassen, 1969) <sup>2</sup>	7	7	7
(3, 3, 3)	(Laderman, 1976) <sup>15</sup>	23	23	23
(4, 4, 4)	$(Strassen, 1969)^2$ $(2, 2, 2) \otimes (2, 2, 2)$	49	47	49
(5, 5, 5)	(3, 5, 5) + (2, 5, 5)	98	96	98
(2, 2, 3)	(2, 2, 2) + (2, 2, 1)	11	11	11
(2, 2, 4)	(2, 2, 2) + (2, 2, 2)	14	14	14
(2, 2, 5)	(2, 2, 2) + (2, 2, 3)	18	18	18
(2, 3, 3)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 15	15	15
(2, 3, 4)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 20	20	20
(2, 3, 5)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 25	25	25
(2, 4, 4)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 26	26	26
(2, 4, 5)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 33	33	33
(2, 5, 5)	(Hopcroft and Kerr, 1971) <sup>1</sup>	<sup>6</sup> 40	40	40
(3, 3, 4)	(Smirnov, 2013) <sup>18</sup>	29	29	29
(3, 3, 5)	(Smirnov, 2013) <sup>18</sup>	36	36	36
(3, 4, 4)	(Smirnov, 2013) <sup>18</sup>	38	38	38
(3, 4, 5)	(Smirnov, 2013) <sup>18</sup>	48	47	47
(3, 5, 5)	(Sedoglavic and Smirnov, 202	21) <sup>19</sup> 58	58	58
(4, 4, 5)	(4, 4, 2) + (4, 4, 3)	64	63	63
(4, 5, 5)	$(2,5,5)\otimes(2,1,1)$	80	76	76

### **Autonomous Driving**

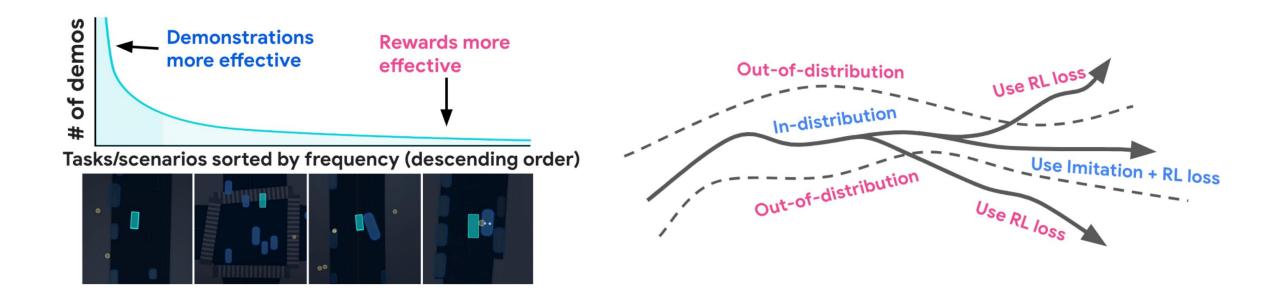

RL in simulators

Self-driving on the road

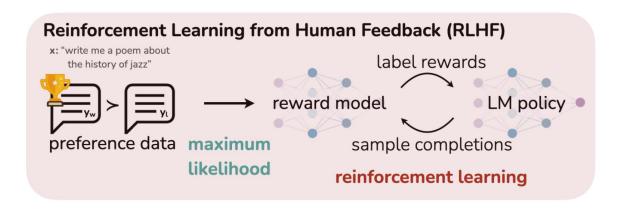

Amini et al., "VISTA 2.0: An Open, Data-driven Simulator for Multimodal Sensing and Policy Learning for Autonomous Vehicles", 2021

### **Autonomous Driving**

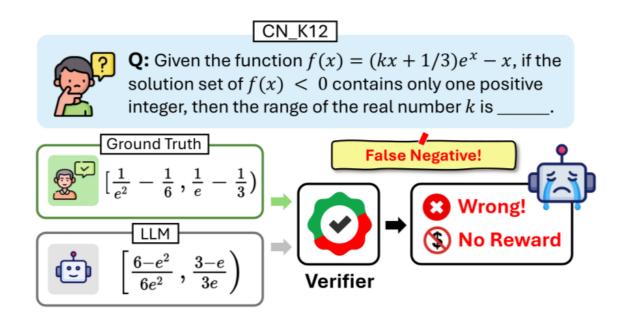

Lu et al., "Imitation Is Not Enough: Robustifying Imitation with Reinforcement Learning for Challenging Driving Scenarios", 2022

### **Post-Training Large Language Models**

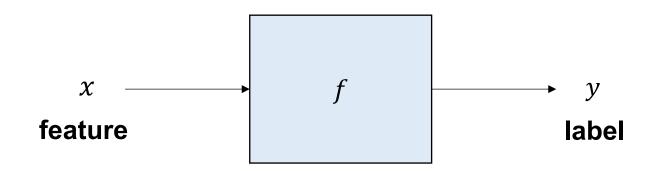

Rafailov et al., "Direct Preference Optimization: Your Language Model is Secretly a Reward Model", 2023

Xu et al. "TinyV: Reducing False Negatives in Verification Improves RL for LLM Reasoning", 2025

## **Closer Look at Reinforcement Learning**

### **Supervised Learning**

$$f$$
 ( cat ) = Cat  $f$  (temperature, humidity,...) = 1000mm precipitation

Given a lot of (x, y) pairs, find an f that such that  $f(x) \approx y$ 

• Reinforce?

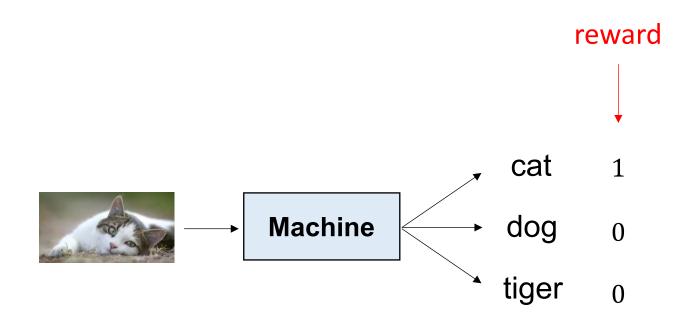

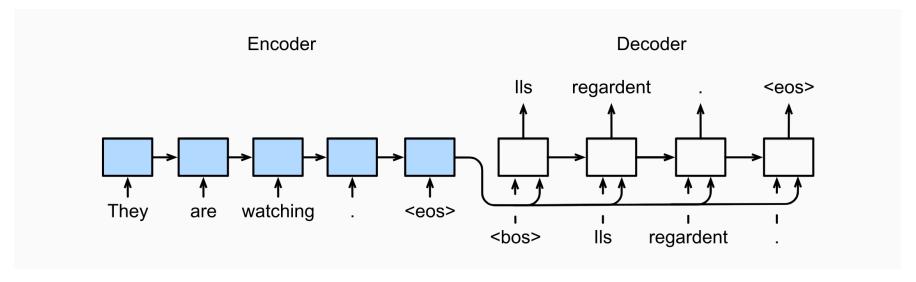

• Reinforce?

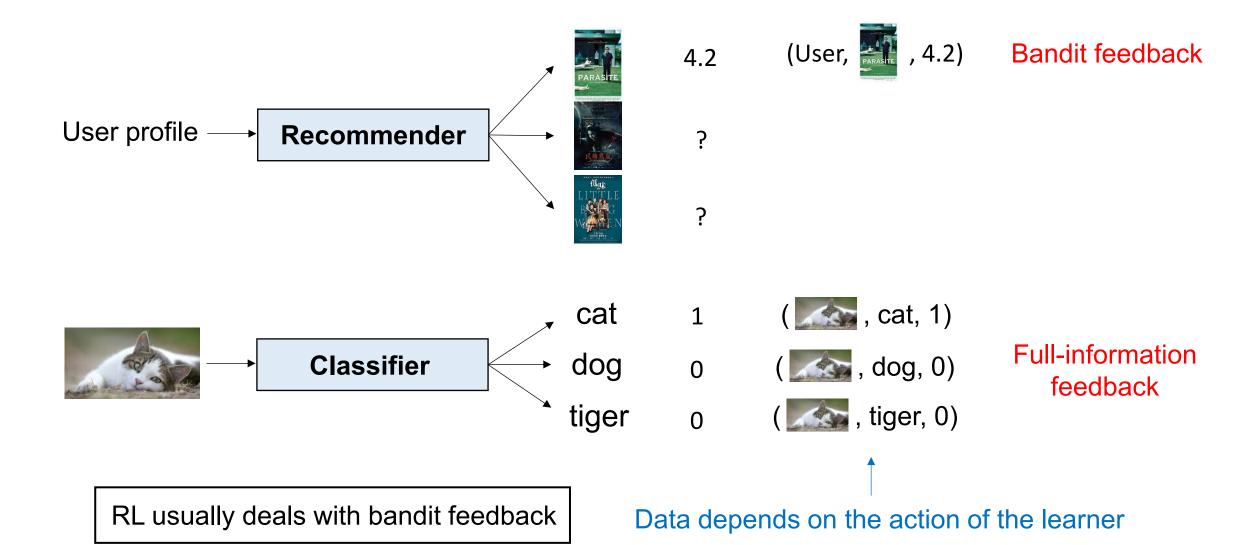

• Learning from reward feedback?

• Learning sequential decision making?

"Dive into Deep Learning"

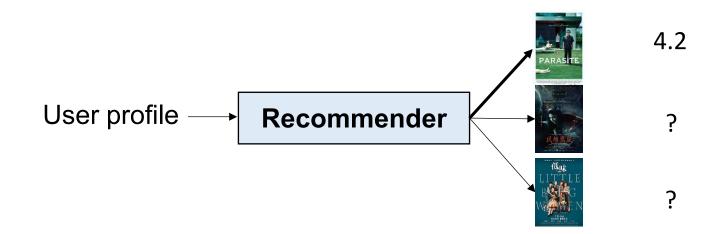

feedback

collected data

### **Bandit Feedback**

• Needs **exploration** 

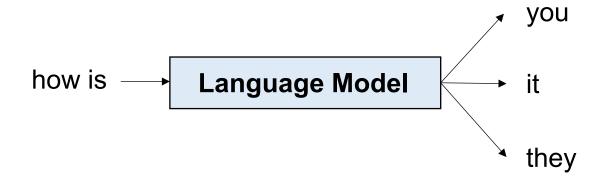

#### **Bandit Feedback**

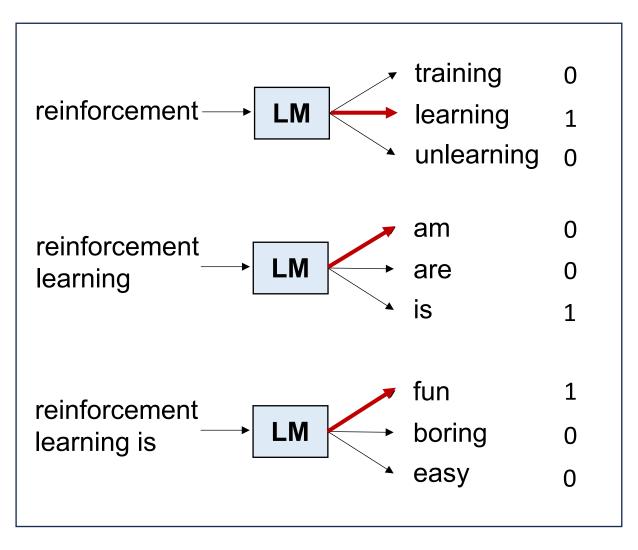

- Learning from reward feedback → Learning from bandit reward feedback
- SL and RL differs in the way of training, not the modeling
- E.g., Bandit classification

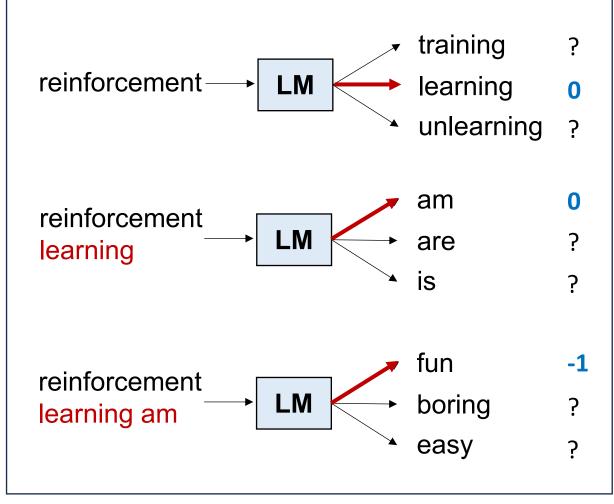

### **RL** in Sequential Decision Making

Often, a task is accomplished by a **sequence of action**, e.g., language.

Full-information feedback

Data does not depend on the actions

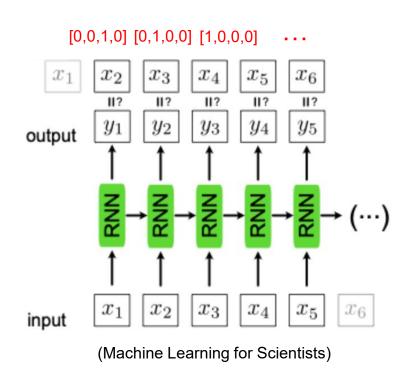

Immediate feedback

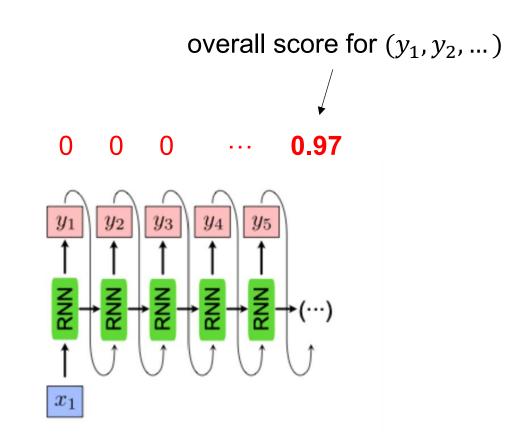

Bandit feedback

Data depends on the actions

Delayed feedback

### **RL** in Sequential Decision Making

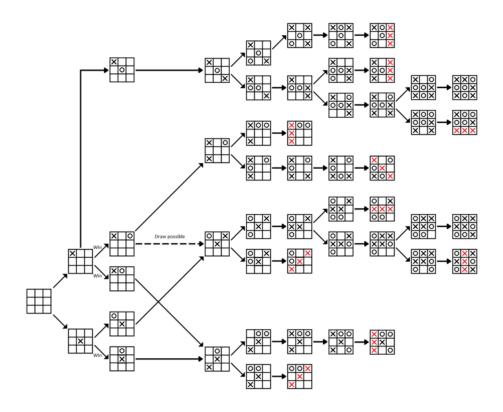

Bandit + **Delayed and Aggregated** Feedback

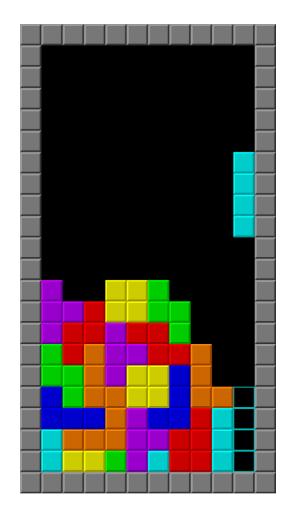

## Delayed and Aggregated Feedback

• Need for (temporal) credit assignment

## Delayed and Aggregated Feedback

• Need for (temporal) credit assignment

### RL in Sequential Decision Making

Learning sequential decision making

→ Learning sequential decision making with bandit and delayed feedback

SL: "what to do in each step" (full-information, immediate)

RL: "how you're doing overall" (bandit, delayed)

### RL Signal Can Be Very Sparse

- "Pure" Reinforcement Learning (cherry)
  - The machine predicts a scalar reward given once in a while.
  - A few bits for some samples
- Supervised Learning (icing)
  - The machine predicts a category or a few numbers for each input
  - Predicting human-supplied data
  - 10→10,000 bits per sample
- Unsupervised/Predictive Learning (cake)
  - The machine predicts any part of its input for any observed part.
  - Predicts future frames in videos
  - ▶ Millions of bits per sample
  - (Yes, I know, this picture is slightly offensive to RL folks. But I'll make it up)

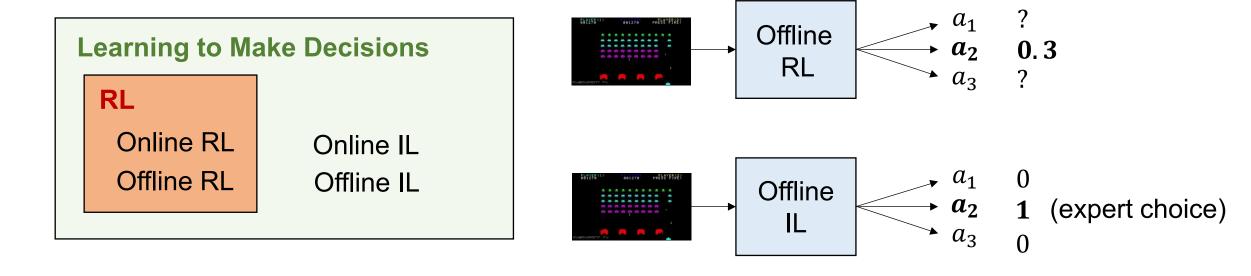

### **Terminologies**

Online RL: through interactions, under bandit / delayed feedback

Offline RL: through existing data, under bandit / delayed feedback

Online IL: through querying expert, under label feedback

Offline IL: through expert data, under label feedback

#### What is this Course About?

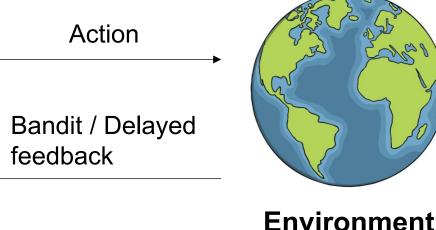

- Built on traditional (i.e., supervised) machine learning techniques, we introduce additional techniques to handle bandit / delayed feedback.
- It's not about a whole new machine learning paradigm. It's a set of techniques that should be properly integrated with other machine learning methods.
- We will largely reuse supervised learning techniques, treating them as black box
  - So, it's better if you've already took machine learning course before

#### **SL** techniques

gradient descent regression classification neural network etc.

#### **RL Techniques**

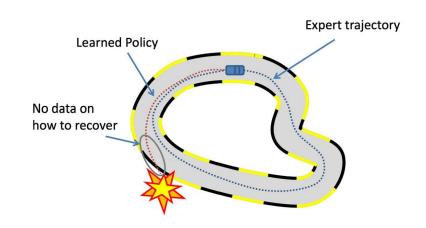

Conversion / Reduction for the purpose of exploration and credit assignment

### When Is IL (SL) Insufficient?

- The truly best policy is unknown / expert is imperfect
  - Atari game, Go
  - Faster matrix multiplication
  - ⇒ RL can **search** for better solutions

- RL signal may more faithfully reflect our real objective
  - RL from Human Feedback
  - ⇒ RL can provide **alignment** to the real objective
- The expert data has limited coverage
  - Autonomous driving
  - ⇒ RL can explore edge cases and **robustify** solutions

# Challenges in RL

## Challenges in RL (1)

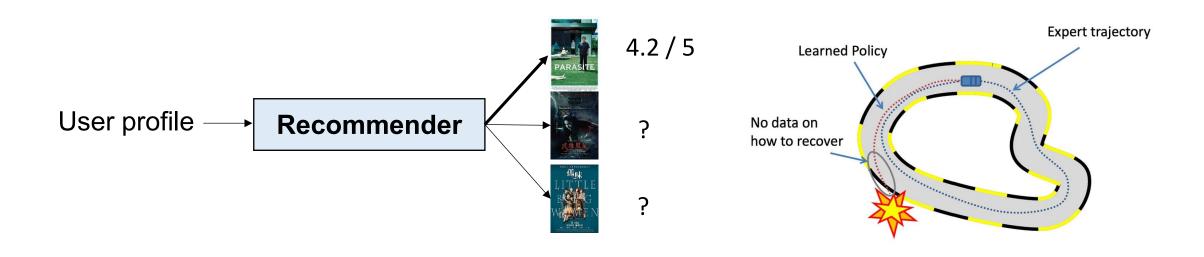

Generalization: a key challenge in all machine learning paradigms

(Khosravian and Amirkhani, 2022)

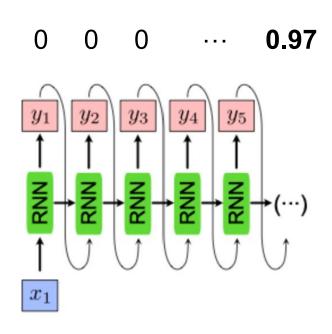

### Challenges in RL (2)

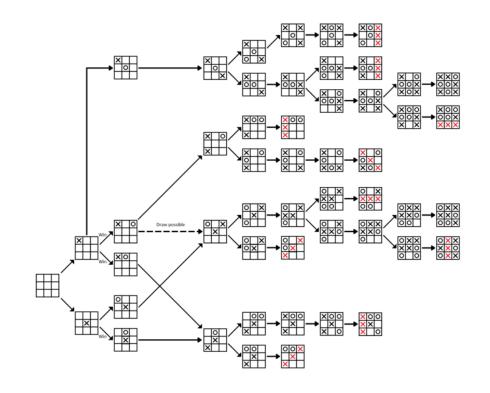

Exploration (in online RL)Partial data coverage (in offline RL)

### Challenges in RL (3)

Credit assignment (due to delayed and aggregated feedback)

Identify the contribution of each action to the outcome

Exploration /
Partial Data Coverage
(:Bandit feedback)

Credit Assignment (:Delayed feedback)

### **Other Challenges**

- Reward design
- Simulation-to-reality gap
- Safety, robustness under attacks, ... (similar challenges are also in SL)
